

BannerMASTER Bracket Installation Instructions

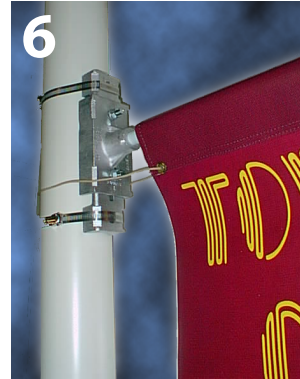

1 Insert stove bolt from behind through elongated slot and hold in place.

5 Install second banding strap on bottom of back plate and tighten down.

2 Place punched plastic spacer over stove bolt on face and slide all the way down. Place second stove bolt from behind through elongated hole and through plastic spacer as shown.

6 Slide banner onto bracket arm at top and loop wire or electric ties through grommets and around lightpole to insure banner will not slide off of arm.

Note: Be sure end of ties are not touching banner.

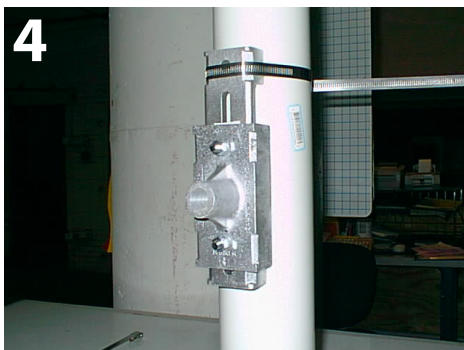

3 Place bracket plate at desired height on lightpole and duct tape to pole to hold in place.

7

Pull banner down to find approximately where the back plate for the bottom bracket should be placed. Try to center back plate so pocket will fall in about the middle for maximum adjustability up and down.

8

Repeat steps 1 through 6 for bottom plate.

4 Wrap the first steel band around back plate at top and tighten down. Remove duct tape and place rod plate over stove bolts.

Special Note: Bracket has a cantilever system built into rod plates. Be sure the arrow on the plate is always pointing at the banner.

For larger banners (over 30" x 60" or when hanging two banners per pole) we advise that you use two stainless steel straps at outside end of back plates, one strap at other end of back plates.
